PUSHOVER ANALYSIS FOR SEISMIC ASSESSMENT AND ...

Pushover analysis is based on the assumption that structures oscillate predominantly in the first mode or in the lower modes of vibration during a seismic event This leads to a reduction of the multi-degree-of-freedom, MDOF system, to an equivalent single-degree-of-freedom, ESDOF system, with properties predicted by a nonlinear static analysis

Pushover Analysis of RC Building

Abstract: Pushover analysis is one of the most-used nonlinear static procedures for the seismic assessment of structures, due to its simplicity, efficiency in modeling and low computational time The previous studies about pushover analysis are almost based on symmetric building structures and unidirectional earthquake excitation

PUSHOVER ANALYSIS OF BUILDING STRUCTURES

term "pushover" analysis of structures can therefore be viewed as a modern variation of classical plastic "collapse" analysis of frame structures Given the fact that a pushover method is a static method which does not require the selection of ground motions and the modeling effort in building a computer model of a
